Presented at the annual meeting of the Psychometric Society (IMPS) in Durham, NH, June 29 – July 2, 2008

Research Motivation

Diagnostic classification models (DCMs) have been proposed in recent years as powerful statistical tools for providing fine grained feedback about multiple skills of learners.

The success of applying these models rests on having appropriately designed diagnostic assessments at hand that contain a sufficient number of items to index each skill.

Research Motivation

However, few empirical examples exist that illustrate how DCMs can provide an added value over alternative multidimensional calibrations of assessment data in these contexts.

Moreover, studies that employ DCMs rarely seek to cross-validate the resulting skill profiles with secondary variables.

Hence, practitioners have few guidelines and case studies for learning about the benefits and limitations of DCMs viz-à-viz scaling alternatives.

Research Questions

1. Can pilot data from a newly developed diagnostic assessment for arithmetic ability in elementary school be successfully scaled with DCMs?

2. How do the model fit and the resulting parameter interpretations differ across the best-fitting DCM and the best-fitting traditional multidimensional scaling model?

3. What lessons can be learned from these analyses about the suitability of the design of the diagnostic assessment and the benefits and limitations of DCMs and alternative scaling models?

Diagnostic Classification Models

Properties of DCMs

Diagnostic classification models…

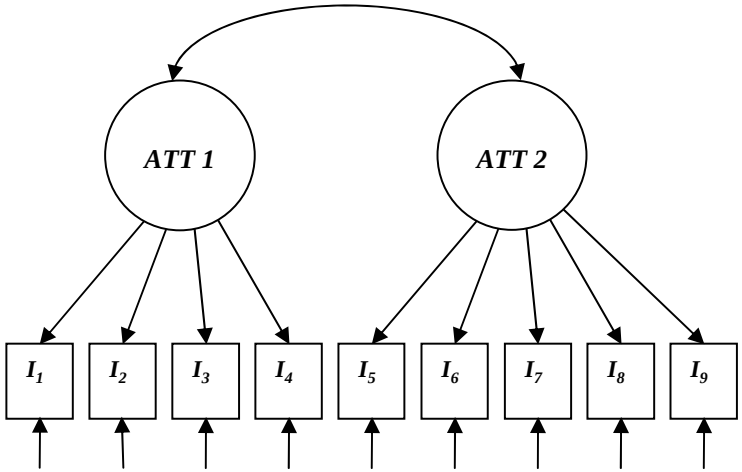
- are restricted latent class models
- are multidimensional latent variable models with discrete latent variables
- provide classifications of learners according to multiple skills
- are designed to handle within-item multidimensionality efficiently
- include compensatory and non-compensatory interactions of latent variables

Properties of DCMs

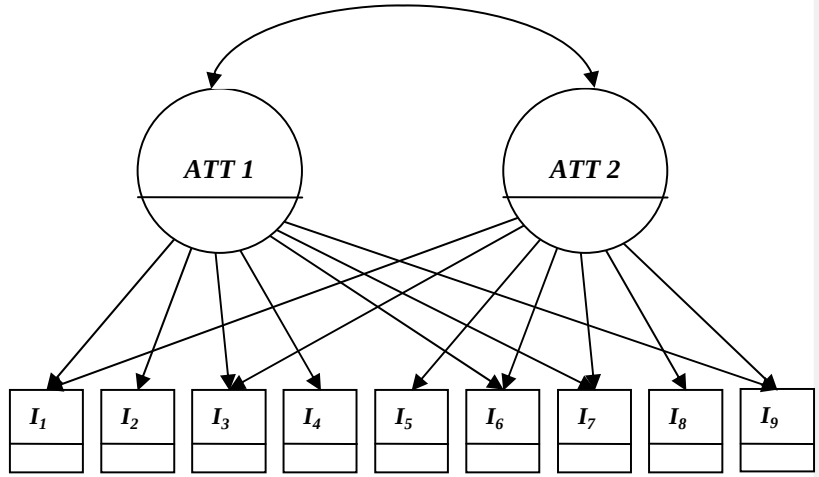
Diagnostic classification models…

- can handle dichotomous and polytomous response variables
- can be estimated with frequentist and Bayesian approaches
- can handle observed and latent mixtures
- can handle nested data structures
- are currently being unified under log-linear estimation frameworks

Illustration of DCMs



Two-dimensional CFA Model with Simple Loading Structure
(Exploratory or confirmatory)



Two-dimensional DCM with Complex Loading Structure
(Confirmatory)

Test & Data-collection Design

Data-collection Design

Sample

n = 241 children in grade 3

n = 223 children in grade 4

All children were selected from the same k = 6 schools located in the federal states of Germany that were part of a network of schools participating in several large-scale assessment studies

Test Administration

Standardized instructions

Trained test administrators (trained graduate students)

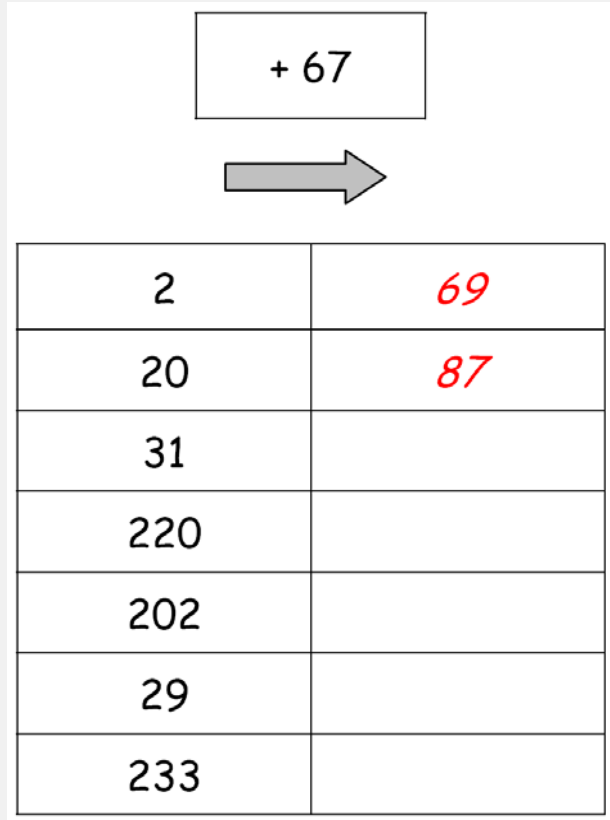
Total testing time = 90 mins. (2 school periods) with a 10-minute break

Test Design (Part I)

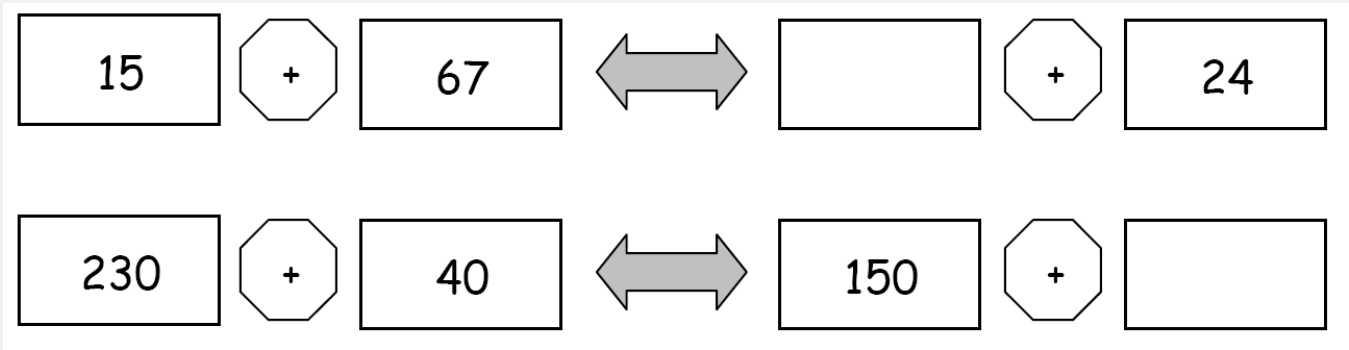
	# Items
A) Basic Arithmetic Skills	
1. Addition	14
2. Subtraction	14
3. Multiplication	12
4. Division	12
5. Combined Skills	20
B) Basic Processing Skills	
1. Knowledge of the decimal system	14
2. Ability to perform carry-over operations	20
3. Ability to perform inverse operations	50
4. Knowledge of the number space over 100	29
C) Modelling Skills (for Contextualized Problems)	39

Sample Items (Context-free)

7	+	5	=	*12*
12	+	12	=	24
20	+	8	=	
2	+		=	101
23	+		=	76
	+	84	=	190



2	*69*
20	*87*
31	
220	
202	
29	
233	



Sample Item (Contextualized)

T_AS5

Marlen has 55 songs on her MP3-Player. Leon has 15 songs less than Marlen. When they go through their song lists, they realize that the lists have 10 songs in common.

How many different songs do Marlen and Leon have altogether?

Marlen and Leon have _____ different songs altogether.

Test Design (Part II)

Context-free / Basic Arithmetic Items

	Total	Carry-over	Inverse	Number Space
Addition	22	10	16	10
Subtraction	22	10	14	7
Multiplication	20	0	18	6
Division	20	0	18	7

Statistical Modelling Approach

1. Model on global arithmetic ability (context-free items; IRT)

2. Model on global arithmetic ability (contextualized items; IRT)

3. Model on basic arithmetic skills (context-free items; IRT & DCM)
   (addition, subtraction, multiplication, division)

4. Model on basic arithmetic skills (contextualized items; IRT & DCM)
   (addition, subtraction, multiplication, division)

5. Higher-order model (context-free items; IRT, & DCM)
   (arithmetic ability + addition, subtraction, multiplication, division)

6. Higher-order model (contextualized items; IRT, & DCM)
   (modelling ability + addition, subtraction, multiplication, division)

7. Model on processing skills (context-free items; IRT & DCM)
   (addition, subtraction, carry-over, inverse, number space)

Compare calibrations across grades to separate calibrations for grades 3 and 4.

DCM Results

	Addition	Subtraction	Multiplication	Division
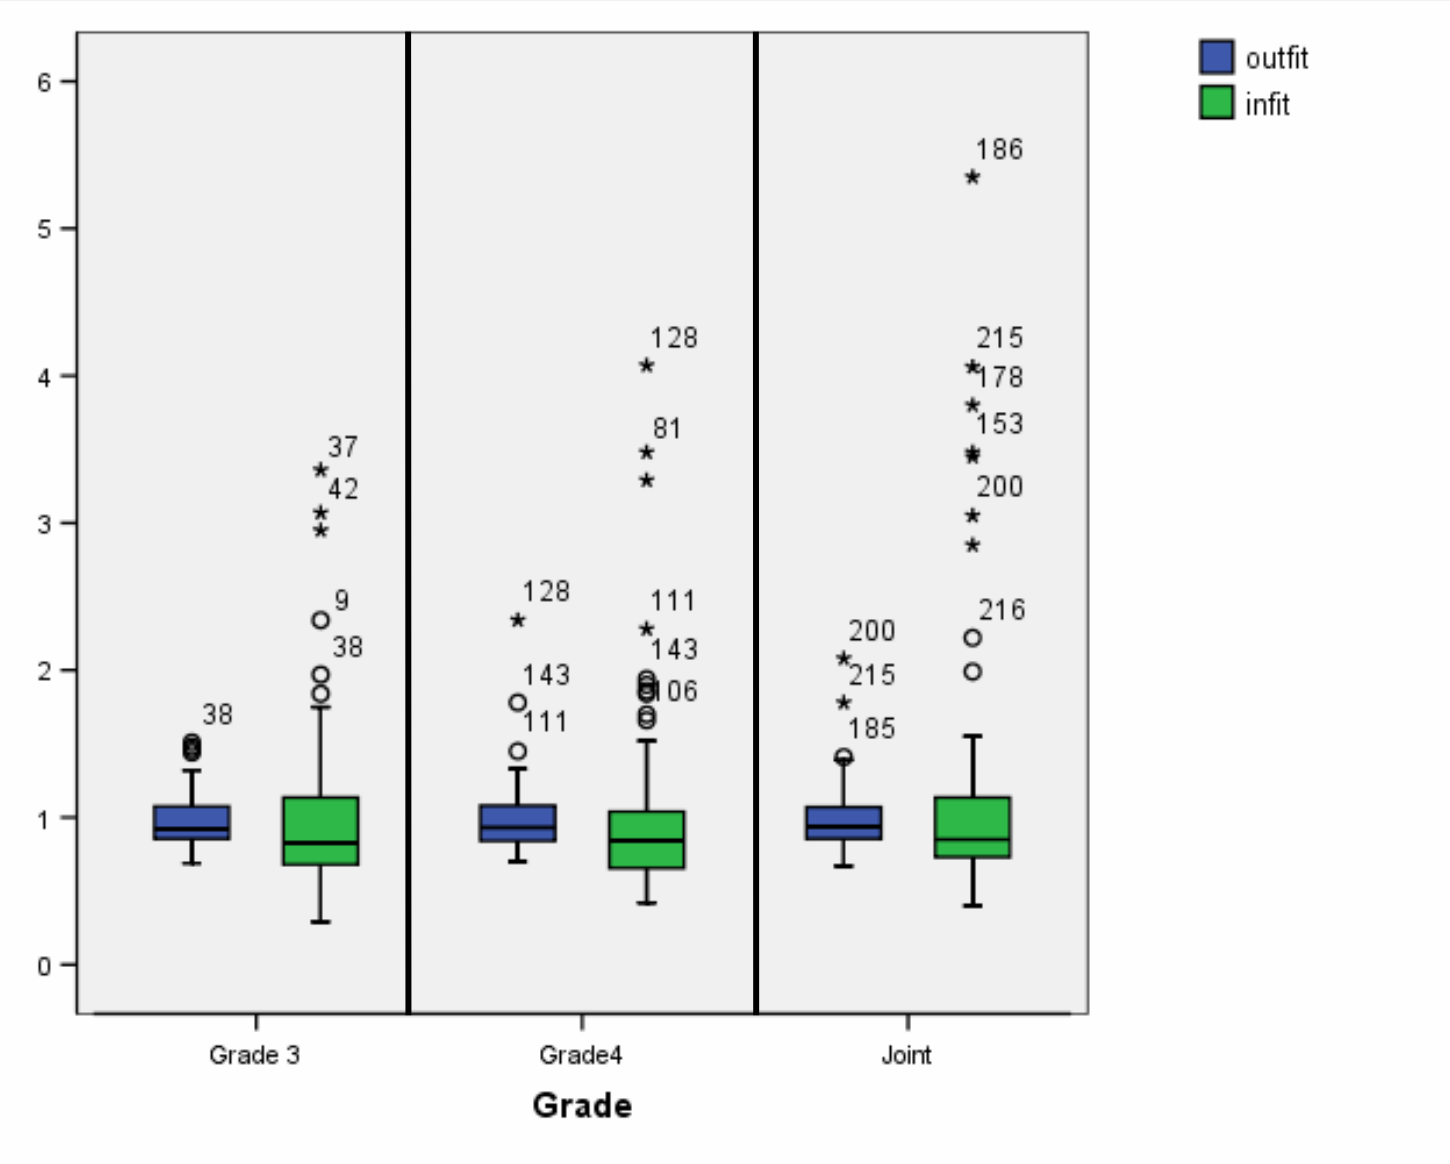
Addition	.89 / .91	.95	.75	.73
Subtraction	.94	.88 / .99	.75	.74
Multiplication	.51	.52	.90 / .99	.99
Division	.39	.40	.95	.92 / .99

Reliabilities = diagonal, Grade 3 = lower off-diagonal, Grade 4 = upper off-diagonal

Fit Information



Consistency of Results between DCM & Multidimensional Rasch Model

Skill	Mean Correlation $(\hat{\theta}_{PV_k}, \hat{\alpha})$ Grade 3	Mean Correlation $(\hat{\theta}_{PV_k}, \hat{\alpha})$ Grade 4	Mean Correlation $(\hat{\theta}_{PV_k}, \hat{\alpha})$ Joint
Addition	.74	.77	.75
Subtraction	.75	.77	.76
Multiplication	.76	.78	.76
Division	.72	.79	.75

Correlations with School Grades in Mathematics for Grade 3 (N = 216) and Grade 4 (N = 188)

	Grade 3		Grade 4	
	DCM	IRT	DCM	IRT
Addition	-0.36	-0.47	-0.38	-0.47
Subtraction	-0.39	-0.48	-0.41	-0.49
Multiplication	-0.37	-0.39	-0.32	-0.44
Division	-0.33	-0.34	-0.36	-0.44

Conclusions

- *Careful test design* paid off reasonably well for these analyses
- *Multidimensional scaling* at least moderately successful with IRT models and DCMs
- *Moderate consistency* between IRT estimates and DCM estimates
- *Empirical separation* of addition / subtraction and multiplication / division challenging with current items and models
- *Additional fine-tuning* of analyses will likely lead to lower-level scaling for diagnostic feedback about sets of arithmetic skills

Outlook

- *Replication* with a larger sample size from field trial
- *Finer look* at local model misfit with subsequent model refinement
- *Additional comparisons* of higher-order IRT models, SEMs, and DCMs
- *Additional comparisons* of multi-level IRT models and DCMs
- *Cross-validation* of from the person parameters in IRT models, SEMs, and skill profiles in DCMs via secondary measures
